## Planning

### **Objective:**

- Implementing both HTML and CSS languages together in a single website
- Showing how to use both languages to enhance viewer experience
- Applying multiple concepts of both languages into the website
- Following requirements that been specified to create the website
- Using one basic Javascript
- Choosing a calm colors and background for viewers to enjoy without problems
- Implementing basic animation and color transformation while transferring from page to page
- Adding a copyright section for the website
- Creating four separate pages that serves different purposes
- Adding a quote at the Home page of the website from my own beliefs
- Allowing visitors to sense a friendly atmosphere while exploring the website

### **Accomplishment:**

Both HTML and CSS were used to make the website and trying to meet the objectives been specified by using both. A background image been implemented to write on it the information needed for all four pages that will be created. With HTML, I was able to create a footer and and all needed contexts that I built the design for it with CSS. I had a little hard time setting the text on top of the background picture but I was able to solve it at the end.

The colors were good and satisfied for me and calm for an viewer to see. Also I added some shadows to the boxes to add a sense of animation while changing from page to page inside the website as well as adding some movement by adding Color Block when hover on it. I tried to add a sense of organization to the website to not lose viewer interest.

For the Javascript, I used the Contact page to greet the viewer for visiting my site.
